Week-15-Pointers

Week-15-01-Practice Session-Coding

Source code

Answer: (penalty regime: 0 %)

Reset answer

```
1 + /*
     * Complete the 'reverseArray' function below.
 2
 3
 4
     * The function is expected to return an INTEGER ARRAY.
 5
     * The function accepts INTEGER ARRAY arr as parameter.
 6
 7
8 +
     * To return the integer array from the function, you should:
 9
10
           - Store the size of the array to be returned in the result_count variable
11
           - Allocate the array statically or dynamically
12
13
     * For example,
14 .
     * int* return integer array using static allocation(int* result count) {
           *result_count = 5;
15
16
17
           static int a[5] = \{1, 2, 3, 4, 5\};
18
19
           return a;
20
21
     * int* return integer array using dynamic allocation(int* result count) {
22 v
23
           *result count = 5;
24
25
           int *a = malloc(5 * sizeof(int));
26
27 v
           for (int i = 0; i < 5; i++) {
28
              *(a + i) = i + 1;
29
30
31
           return a;
32
33
34
     */
35
    #include<stdlib.h>
    #include<stdio.h>
36
37
38 +
    int* reverseArray(int arr_count, int *arr, int *result_count) {
        int* reverseArr=malloc(arr_count*sizeof(int));
39
40
41 *
        if(reverseArr==NULL){
42
            *result count=0;
43
            return NULL;
44
        }
45
46 +
        for(int i=0;i<arr_count;i++){
47
            reverseArr[i]=arr[arr_count-1-i];
48
49
        *result count=arr count;
50
        return reverseArr;
51 }
```

<u>Result</u>

| | Test | Expected | Got | |
|---|---|----------|-----|---|
| ~ | int arr[] = {1, 3, 2, 4, 5}; | 5 | 5 | ~ |
| | int result_count; | 4 | 4 | |
| | <pre>int* result = reverseArray(5, arr, &result_count);</pre> | 2 | 2 | |
| | for (int i = 0; i < result_count; i++) | 3 | 3 | |
| | printf("%d\n", *(result + i)); | 1 | 1 | |

Question 2
Correct
Marked out of 1.00
F Flag question

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of minLength or more, and it can only make one cut at a time. Given the array lengths: representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

Example

n = 3

lengths = [4, 3, 2]

minLength = 7

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minlength = 7, the final cut can be made. Return "Possible".

Example

n = 3

lengths = [4, 2, 3]

minLength = 7

The rod is initially sum(engths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot be made, the answer is "Impossible".

Function Description

Complete the function cutThemAll in the editor below.

cutThemAll has the following parameter(s):

int lengths[n]: the lengths of the segments, in order

 $\ensuremath{\textit{int minLength}}\xspace$ the minimum length the machine can accept

Returns

string: "Possible" if all n-1 cuts can be made. Otherwise, return the string "Impossible".

Constraints

- · 2 s n s 105
- . 1 ≤ t ≤ 10⁹
- 1 ≤ lengths[i] ≤ 10⁹
- · The sum of the elements of lengths equals the uncut rod length.

Answer: (penalty regime: 0 %)

Reset answer

```
* The function is expected to return a STRING.
 5
     * The function accepts following parameters:
 6
       1. LONG_INTEGER_ARRAY lengths
 7
     * 2. LONG_INTEGER minLength
 8
 9
10 .
11
     * To return the string from the function, you should either do static allocation or dynamic allocation
12
13
     * For example,
14
     * char* return_string_using_static_allocation() {
15
           static char s[] = "static allocation of string";
16
17
           return s;
     * }
18
19
20 +
     * char* return_string_using_dynamic_allocation() {
           char* s = malloc(100 * sizeof(char));
21
22
23
           s = "dynamic allocation of string";
24
25
           return s;
     * }
26
27
28
29
    #include<stdio.h>
30
    #include<stdlib.h>
31
    #include<string.h>
32
33 1
    char* cutThemAll(int lengths_count, long *lengths, long minLength) {
34
        long totalLength=0;
35
        for(int i=0;i<lengths_count;i++){</pre>
36
            totalLength+=lengths[i];
37
38
39
        for(int i=0;i<lengths_count;i++){
40
            totalLength-=lengths[i];
            if(totalLength>=minLength){
41
42
                long remainingLength=totalLength-minLength;
43
                if(remainingLength<=minLength){
44
                    char *result=(char*)malloc(9*sizeof(char));
45
                    strcpy(result, "Possible");
46
                    return result;
47
                }
48
49
            totalLength+=lengths[i];
50
51
        char *result=(char*)malloc(11*sizeof(char));
52
        strcpy(result, "Impossible");
53
        return result;
54
    }
55
```

Result

| | Test | Expected | Got | |
|----------|---|------------|------------|---|
| ~ | <pre>long lengths[] = {3, 5, 4, 3}; printf("%s", cutThemAll(4, lengths, 9))</pre> | Possible | Possible | ~ |
| V | <pre>long lengths[] = {5, 6, 2}; printf("%s", cutThemAll(3, lengths, 12))</pre> | Impossible | Impossible | ~ |
